OmniBazaar — The Non-Custodial Everything Exchange

Investor Summary
July 2026
app.omnibazaar.com

One app. Every market. Zero custody.

LIVE ON MAINNET · APRIL 2026 | OWN GASLESS L1 (AVALANCHE SUBNET) | WEB · EXTENSION · ANDROID

PROBLEM

Crypto fragmented into a dozen vertical apps — a DEX for spot, Hyperliquid for perps, Polymarket for predictions, Aave for yield, OpenSea for NFTs — each with its own custody risk, gas token, and KYC. The custodial everything-exchanges (Coinbase, Binance, Robinhood) prove users want one venue, but they hold your funds, harvest your data, and gatekeep listings by construction.

SOLUTION — SHIPPED, NOT PLANNED

Every crypto vertical behind one non-custodial, fully gasless interface (EIP-2771 meta-transactions — users never buy a gas token), with one-click privacy on demand, running on our own Avalanche L1 with 1–2s finality. Three clients ship in lockstep: web app, 80+-chain browser-extension wallet, and Android. **“We route. You hold.”**

SIX VERTICALS LIVE IN PRODUCTION (COUNTERS VERIFIED JULY 2026)

Spot DEX
`11.3K+ tokens`
Own order book + routing to Uniswap, 0x, THORChain on 5 chains

Perpetuals
`968 markets`
Aggregated from Hyperliquid + Aster via builder codes

Predictions
`2.35M+ markets`
Cross-venue discovery + live Polymarket order routing

Yield / RWA
`31K+ · 5.7K+`
Non-custodial deposit routing; 20+ RWA issuers aggregated

Marketplace
`escrow live`
P2P with 2-of-3 escrow; local listing-node model

NFTs
`106.9K+ items`
Indexed art layer with minting and launchpad

WHY NOW

- **Prediction markets exploded:** Kalshi ~$178B annualized volume; Polymarket ~$1B annualized revenue.
- **The category is funded:** Paradigm seeded Liquid (non-custodial aggregator) $7.6M, Mar 2026; Coinbase Ventures’ 2026 outlook names prediction-market aggregators “the dominant interface layer.”
- **Regulation moved our way:** SEC dropped the Uniswap and Consensys cases — custody is the liability; routing is not.
- **AI changed build economics:** one senior engineer + AI agents shipped the entire stack at <$500/mo burn.

BUSINESS MODEL — A FEE IN EVERY FLOW

Marketplace (seller pays)	1.0%	Perps builder fee	4 bp
DEX taker / maker	20 bp / −5 bp	Predictions builder fee	50 bp
Swap interface	25 bp	Yield/RWA routing	25 bp

Referrals (70/20/10, two-level) are paid from collected fees — the growth loop is a fee split, not an emission. Validators are never direct fee recipients.

13 years on one thesis

Started 2013; v1 shipped a working decentralized marketplace to ~10,000 users on BitShares tech — right idea, too early. Rebuilt from scratch 2024–26: a live L1 (chain 88008, 5 validators), 100+ smart contracts, medianized validator oracles, COTI-powered privacy, and ~5,000 legacy users’ balances preserved on-chain awaiting reactivation. Two US patents (founder-held). Traction is deliberately early — 42 registered users, ~$10K early-LP TVL — distribution begins with this raise.

The round: $500K at $5M for 10%

Instrument flexible: ODDAO ownership tokens (proportional ownership + profit distribution) or SAFE into a Delaware/Cayman topco formed at closing; token side letter available. $25K minimum · private placement · accredited and non-US investors.

Default alive by design

Benchmark-built 5-year model: $500K angel + $2.2M seed carries the company to operating break-even at the 3-year mark and Year-4 profitability — no further rounds required. Y5 base case: 96K MAU, $3.1M net revenue, +$0.8M EBITDA. Full model in the data room.
